DECENTRALIZED SETTLEMENT · STELLAR TESTNET

The standard for settlement.

Engineered for cryptographic certainty. SplitStellar resolves cross-border shared expenses on the Stellar network with sub-second finality.

```
fn execute_settlement(  
  env: Env, pool_id: BytesN<32>,  
  payer: Address,  
) -> Result<(), Error>
```

Splitting expenses across borders is still broken

Friend groups and remote teams routinely split costs across currencies — and every existing option loses money, time, or trust along the way.

Manual IOUs

Tracked in chat threads or spreadsheets. Debts get forgotten and rarely get settled.

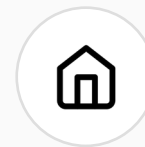

NEVER SETTLED

Venmo / PayPal

Cross-currency transfers carry 3–5% FX fees and settle 1–3 days later.

3–5% FX FEE

Bank wires

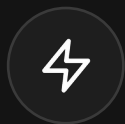

Flat fees of \$25–50 per transfer, regardless of the amount being moved.

\$25–50 / XFER

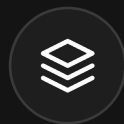

None of them work seamlessly across currencies. A user paying in USD while a teammate owes in EUR means multiple conversions and days of waiting.

Built on the one network designed for this

Native multi-asset payments

USDC, EURC and XLM can move within the same transaction.

Built-in DEX

Path payments route the cheapest conversion automatically.

Anchor network

Fiat on/off-ramps via regulated anchors like MoneyGram.

Soroban smart contracts

Custom settlement logic runs on-chain — pools, balances, approvals.

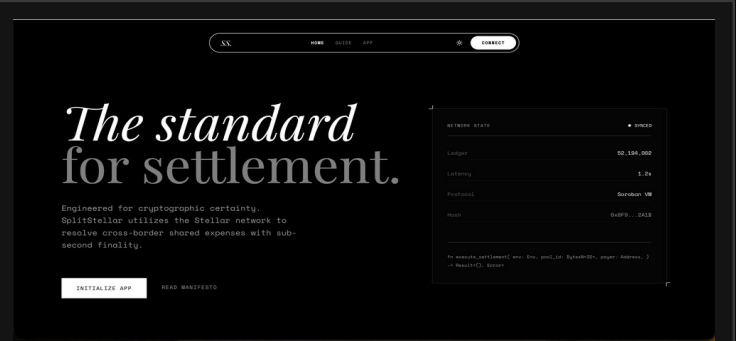

~5 second finality

Transactions confirm in ~5s at roughly \$0.00001 per operation.

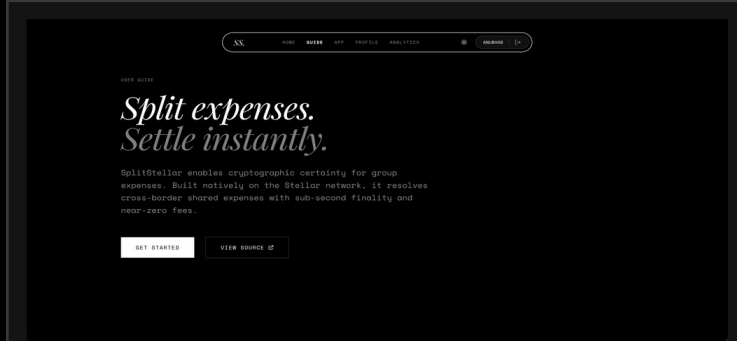

The interface, live

FRONTEND TESTS

CONTRACT ID CAG5MXEQ0RC4ZP57WI4WJVXWHP5CZHXXMA77VV63JVSU42GNMJYAMUCJ

- `create_pool`
- `is_pool_member`
- `log_expense`
- `get_expense`
- `get_pool_members`
- `get_pool`
- `add_pool_member`
- `get_pool_expenses`
- `verify_balance`

verify_balance calls the standard Stellar token interface for cross-contract balance checks.

ERROR CODES

- 1 `PoolNotFound`
- 2 `NotPoolCreator`
- 3 `InsufficientBalance`
- 4 `AmountZero`
- 5 `NotPoolMember`
- 6 `PoolNameTooLong`
- 7 `DescriptionTooLong`
- 8 `PoolFull`
- 9 `Unauthorized`

Hardened at every layer — Level 5

Pool Membership Validation

Only pool members can log expenses

Access Control

Only the creator can add members

Invite Code Validation

8-character format, alphanumeric only

Rate Limiting

Event polling with exponential backoff

Input Validation

Names ≤ 64 chars, descriptions ≤ 128 , amount > 0

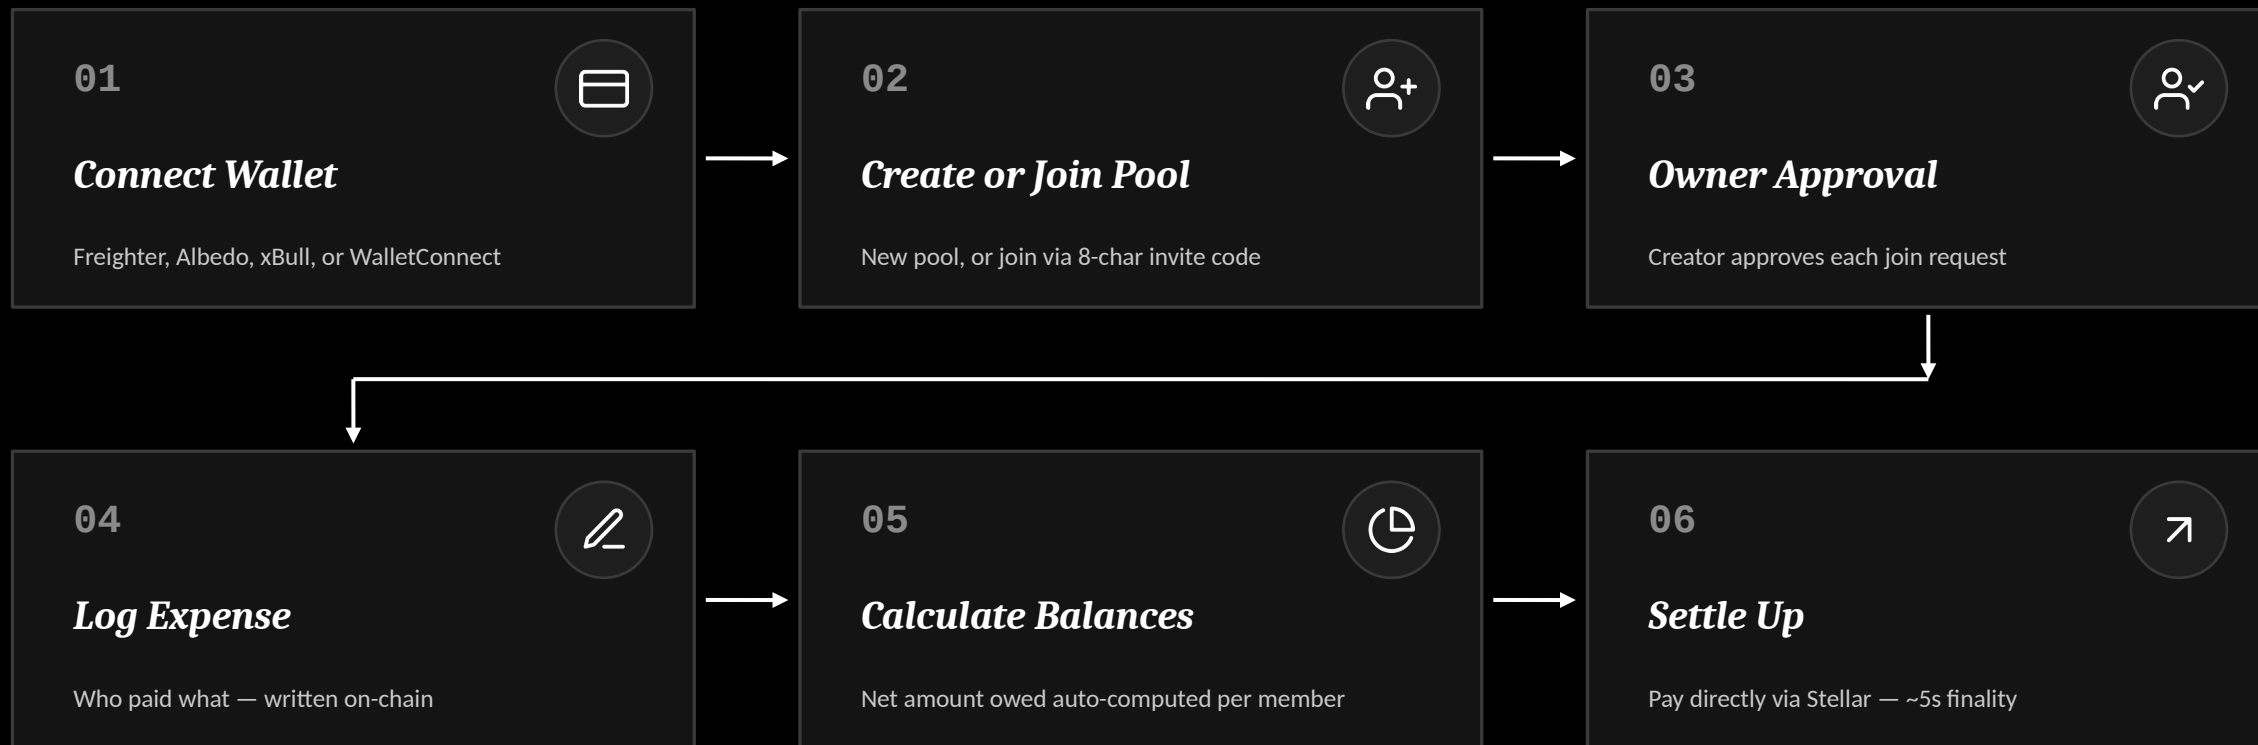

XSS Prevention

Input sanitization on all user inputs

From the field — testers flagged that random pool IDs were guessable and joinable without confirmation. **Addressed:** invite-code-gated access plus owner approval now ships by default.

From connected wallet to settled balance

Market Opportunity

Expense splitting is a daily, cross-border problem — still solved with IOUs and spreadsheets

WHY NOW — THE RAILS ALREADY EXIST

Multi-asset rails

Native transfers + built-in DEX

Soroban automation

Contracts compute who owes whom

On-chain transparency

Removes the trust problem entirely

OUR WEDGE — GROUP EXPENSE POOLS

Who

Friends, roommates, remote teams, event organizers

Start

Expense splitting on Stellar testnet — crypto-native early adopters

Expand

Multi-currency settlement, fiat on-ramps, then mainnet launch

COMPETITIVE POSITION

vs. Splitwise/Tricount — we auto-settle in real currency

vs. Venmo/Zelle — cross-border, ~5s finality

vs. existing DeFi — one simple UX for an everyday need

Proven on testnet. Shipping toward mainnet.
